

HYDROGEN PRICE BOOK

Q4 2026 • Supply options for British industry

Indicative pricing for gaseous, compressed, renewable, certified low-carbon, high-purity and liquid hydrogen.

ISSUED 10 OCTOBER 2026

Commercial brochure • Great Britain

HYDROGEN FOR THE NEXT PHASE OF BRITISH INDUSTRY

H2UK's proposed supply model connects customers with hydrogen producers and specialist distributors through clear product specifications, volume tiers and contract options. The goal is dependable supply, transparent pricing and a practical route from first deliveries to long-term industrial offtake.

A transparent starting point — not a spot-market quote. All prices in this brochure are illustrative planning ranges, ex-VAT, and subject to supplier confirmation, specification, location, logistics and contract terms.

Who this is for

Industrial manufacturers • chemical and process businesses • fleet and mobility operators • laboratories and research users • project developers • procurement teams evaluating hydrogen supply.

Hydrogen supply, by volume

Indicative delivered or ex-works commercial ranges vary materially by product, annual volume, purity, pressure, production pathway and distance. Each quotation should identify what is included in the price.

Product / annual volume	Indicative price	Typical supply arrangement
Industrial gaseous hydrogen 100 kg–1 tonne	£18–£28/kg	Trial deliveries; short-term
Industrial gaseous hydrogen 1–10 tonnes	£14–£22/kg	Small business; 12 months
Industrial gaseous hydrogen 10–100 tonnes	£11–£17/kg	Regional supply; 1–3 years
Industrial gaseous hydrogen 100–1,000 tonnes	£8–£13/kg	Industrial offtake; 3–5 years
Anchor industrial supply 1,000–10,000 tonnes	£6.50–£10.50/kg	Long-term; bespoke logistics
Major offtake 10,000+ tonnes	£5.50–£9/kg	Negotiated project-linked contract

Renewable and certified low-carbon hydrogen

Annual volume	Renewable hydrogen	Certified low-carbon hydrogen
1–10 tonnes	£15–£25/kg	£13–£22/kg
10–100 tonnes	£12–£20/kg	£10–£17/kg
100–1,000 tonnes	£9–£15/kg	£8–£13/kg
1,000–10,000 tonnes	£7–£12/kg	£6.50–£10.50/kg
10,000+ tonnes	£6–£10/kg	£5.50–£9/kg

Pricing note: These are proposed price bands for commercial planning, not verified Q4 spot prices, firm offers or claims of currently available capacity. Low-end prices depend on competitive production costs, utilisation, infrastructure and contract structure. Renewable and low-carbon claims require appropriate evidence and certification.

Purity, pressure and cryogenic supply

Product	Indicative price	Typical application / notes
High purity 99.9%	£15–£25/kg	General specialist industrial use
High purity 99.99%	£20–£35/kg	Specialist manufacturing
High purity 99.999%	£25–£45/kg	Laboratories and analytical use
Ultra-high purity / bespoke	£35–£80+/kg	Specification and testing dependent
Liquid hydrogen, specialist research	£25–£45/kg	Cryogenic storage and handling required
Liquid hydrogen, larger offtake	£12–£28/kg	Volume and logistics dependent
Compressed hydrogen for fleets	£9–£30/kg	Site utilisation, compression and dispensing affect delivered price

Choose a contract structure

Contract type	Best suited to	Price mechanism
Trial supply	Initial validation and testing	Quoted delivery / fixed short term
Small-business supply	Recurring low-volume use	Fixed or indexed
Industrial offtake	Regular production demand	Volume bands; indexed or hybrid
Strategic offtake	Large customers and new projects	Negotiated formula; capacity reservation

Every quote should specify: product purity; pressure and delivery temperature; annual and peak demand; delivery location; packaging or tank requirements; delivery frequency; certification; price basis (ex-works or delivered); transport and handling; taxes; price-review formula; minimum-volume terms; and contingency arrangements.

Safety and suitability

Hydrogen requires purpose-designed equipment, trained operators, appropriate storage and transfer procedures, and compliance with applicable safety and transport requirements. Liquid hydrogen involves additional cryogenic hazards. H2UK would confirm technical suitability before accepting an order.

A market moving from projects to infrastructure

The UK hydrogen opportunity is developing in stages: early production projects, first industrial offtake, regional transport and storage infrastructure, and potential new uses in dispatchable power. The growth case is real, but its pace depends on cost, policy execution, infrastructure delivery and customers signing bankable contracts.

Why the market could grow

- **Industrial demand:** hydrogen is already used as a feedstock in some industries and may serve selected processes where direct electrification is difficult.
- **Production support:** the UK Hydrogen Production Business Model is designed to help address the cost gap between low-carbon hydrogen and conventional alternatives, supporting investment where projects qualify.
- **Regional networks:** government planning points to development of the first regional hydrogen transport and storage network from 2031, linking producers with industrial and energy users.
- **Hydrogen-to-power:** the July 2026 Clean Flexibility Roadmap describes a potential post-2030 role for low-carbon dispatchable power, alongside batteries and other long-duration flexibility technologies.
- **British supply chains:** electrolysers, power electronics, valves, piping, compression, storage, testing, engineering and logistics could all create opportunities for domestic suppliers.

Signals to watch in Q4 2026 and beyond

Signal	Why it matters to buyers and suppliers
Hydrogen Allocation Round developments	May improve visibility of future production capacity; project selection is not the same as operational supply.
Transport and storage business models	Could help address infrastructure cost and coordination barriers; timing and final terms matter.
Customer offtake agreements	Committed demand is essential to project finance and reliable delivery.
Electricity and gas prices	Major determinants of production economics for different pathways.
Standards and carbon accounting	Determine whether hydrogen qualifies for a particular low-carbon claim or customer requirement.

Market outlook is not a guarantee

Hydrogen is not the most efficient or lowest-cost answer for every energy use. The strongest near-term cases are likely to be applications with a clear industrial need, suitable infrastructure and a customer willing to contract. The timing and scale of future demand remain uncertain.
