MARKET INFRASTRUCTURE FOR BRITISH AGRICULTURE

British AgriSpot

Investor and Economic Prospectus

Executable spot contracts. Connected supply chains. Better agricultural market data. Finance linked to real trade.

STRATEGIC THESIS | MARKET DESIGN | REVENUE MODEL | EXECUTION ROADMAP

12 October 2026 | Prepared for economists, investors and commercial partners

A proposed British agricultural market platform. Commercial hypotheses and financial scenarios are explicitly identified as such.

01 / INVESTMENT OVERVIEW

Build the transaction layer for British agriculture

British AgriSpot is a proposed B2B market and workflow platform that connects agricultural pricing, physical contracts, delivery, input procurement and selected financial services.

The investment thesis is that agricultural commerce becomes more transparent and financeable when price discovery and the physical transaction are recorded in one connected system. AgriSpot should establish a trusted physical market first, then layer automation, procurement software and financial partnerships around actual trading activity.

£8.4bn
UK total income from farming, 2025

£11.4bn
UK crop output, 2025

£1.78bn
Fertiliser expenditure, 2025

These are indicators of underlying economic activity, not AgriSpot revenue forecasts or its addressable market. The official 2025 accounts also report £22.2bn in livestock output and £21.6bn in intermediate consumption. [1][2]

The product thesis

- Spot market: executable bids and offers for specified commodities, grades, locations, volumes and delivery windows.
- Operations: contract-to-delivery workflow covering logistics, quality evidence, invoices and payment reconciliation.
- Procurement: repeat purchasing for fertiliser and selected farm inputs, compared on delivered and nutrient-adjusted economics.
- Financial connections: transaction information for eligible receivables and inventory finance, plus access to appropriate hedging providers.

What must be proven

- Liquidity in a tightly chosen set of commodity-region lanes, measured by executed trades and repeat use.
- Dependable delivery and settlement records that both buyers and lenders trust.
- A fee structure that delivers positive contribution after onboarding, support, payment and dispute costs.

> **Investment view**
> The near-term case is a focused agricultural B2B marketplace with workflow software. The longer-term case is market infrastructure for data, procurement and finance. Derivatives and balance-sheet lending are options, not prerequisites for proving the business.

02 / MARKET CONTEXT

An economically material market with volatile outcomes

The latest official figures show why better pricing and cost control could matter, while also cautioning against treating all agricultural segments as one uniform market.

INDICATOR	LATEST OFFICIAL FIGURE	RELEVANCE TO AGRISPOT
Total Income from Farming (TIFF)	£8.4bn in 2025; +20.5% vs 2024	Farm income can move sharply year to year; planning and risk tools may help, but do not remove production risk.
Agriculture GVA	£15.9bn in 2025	Measures agriculture contribution to the UK economy, not the size of a software market.
Crop output	£11.4bn in 2025; -3.1% vs 2024	Crop categories diverged; local grade, timing and price information matter.
Livestock output	£22.2bn in 2025; +10% vs 2024	Potential later adjacency, with distinct procurement and contract requirements.
Intermediate consumption	£21.6bn in 2025	Large recurring input-cost base provides context for procurement tools.
Fertiliser expenditure	£1.779bn in 2025	A sizeable input category for supplier comparison and demand aggregation.
Utilised agricultural area	17.0m hectares in 2025	Shows the scale of production land, not a direct count of addressable customers.

Source: Defra, Agriculture in the United Kingdom 2025, updated 3 September 2026; Total Income from Farming in the UK in 2025. Values are current-price measures unless specified. [1][2]

Market interpretation

The strongest argument is not that British agriculture is uniformly underperforming. The official accounts show a rise in aggregate farm income in 2025, driven in part by strong livestock prices, alongside a decline in crop output value and mixed outcomes across individual crops. This heterogeneity supports the case for granular price and contract information.

For investors, the addressable market should be calculated bottom-up: target commodity volumes in initial regions, realistic share of those transactions moving through the platform, chargeable transaction value, and attainable software customers. National farm output is a context metric, not a TAM calculation.

> **Commercial implication**
>
> Build the first market where products, specifications and delivery can be standardised. Do not confuse the size of the British agricultural economy with the amount AgriSpot can capture.

03 / PRODUCT THESIS

Executable spot prices: from information to trade

AgriSpot should show not just what a commodity is said to be worth, but what an eligible buyer is prepared to pay on defined terms.

A published reference price is not the same as an executable offer. Physical prices vary by grade, location, timing, quantity, storage, transport and payment terms. The proposed product makes those conditions visible and lets a buyer and seller conclude a recorded transaction.

Illustrative market screen

FIELD	EXAMPLE CONTRACT
Commodity	Feed wheat, defined contractual grade
Location	Yorkshire collection point / nominated destination
Quantity	300 tonnes available
Delivery	Specified November 2026 delivery window
Firm bid	£175/t
Firm offer	£180/t
Indicative midpoint	£177.50/t - not itself executable
Execution	Accept / negotiate / issue contract, subject to status and counterparty controls

All example prices and transaction details are hypothetical, not current market quotes.

Minimum viable contract record

- Commodity, grade, quantity, tolerance, moisture / quality rules where relevant, location and delivery window.
- Buyer and seller identities, credit / onboarding status, contract version and accepted commercial terms.
- Price basis, transport responsibility, sampling and weighing rules, payment terms, dispute process and force-majeure provisions.
- Lifecycle status: indicative, firm, accepted, fulfilled, disputed, cancelled or settled.

Price discovery should be regional and specification-aware. Over time, the platform can publish transaction-backed price histories and local basis information, provided there are enough representative trades and the methodology protects confidential commercial information.

> **Design principle**
> A price should be labelled executable only when its volume, validity, counterparty eligibility and contract conditions are clear. Otherwise label it indicative.

04 / OPERATIONS

Automate the physical transaction, not just the listing

The marketplace becomes more defensible when it also helps complete the trade: from contract formation to delivery evidence and settlement.

01 Availability

Farm or merchant records a lot with quality, location, volume and sale window. Data may come from farm software or be entered manually.

02 Matching & execution

Buyer and seller agree terms. The platform records the contract, obligations and approval trail.

03 Logistics

Delivery windows, vehicles, storage and collection slots are coordinated through participating providers.

04 Quality & weight

Sampling, grading, weighbridge records and quantity adjustments are associated with the relevant contract.

05 Invoice & settlement

The system reconciles contract, delivery and invoice records, then tracks payment against agreed terms.

06 Market data

Completed and verified trades update transaction histories, delivery performance and eligible analytics.

Potential efficiency gains

- Fewer duplicate entries, calls and manual reconciliations across growers, merchants, hauliers and processors.

- Better use of storage and transport where the system can combine compatible deliveries without compromising grade segregation or deadlines.

- Earlier visibility of payment delays, delivery exceptions and stock that is already committed.

Automation does not guarantee cost savings. Savings must be measured against a baseline and netted against platform fees, onboarding, integrations and any additional verification costs. The start-up should integrate with existing systems before attempting to build proprietary hardware or robotics.

Policy context: Defra and Innovate UK announced a £20m Farming Futures R&D; competition for agricultural automation and robotics on 3 August 2026; the stated competition closed on 30 September 2026. This is evidence of policy interest, not an open grant available to AgriSpot today. [6]

05 / INPUT PROCUREMENT

Fertiliser: an adjacent market with year-round relevance

A farm is both a seller of crops and a buyer of inputs. AgriSpot can connect output markets with repeat procurement decisions.

UK fertiliser expenditure was reported at £1.779bn in 2025, up from £1.687bn in 2024. Fertiliser is therefore a material input category, but its products cannot be compared on headline price per tonne alone. [2]

The procurement workflow should standardise product identity, nutrient content, delivery terms, packaging, availability and required documentation. Comparisons may include delivered cost per unit of nutrient and the agronomic conditions relevant to the product, with performance claims supported by evidence.

CATEGORY	PLATFORM FUNCTION	CONTROL REQUIRED
Conventional nitrogen, phosphate and potash	Supplier offers, delivered-price comparison, forward purchase and delivery scheduling	Composition, specification, safety and delivery verification
Specialist blends	Compare products against a stated crop / soil plan	Agronomic validation; no false equivalence based on price alone
Controlled-release products	Present verified characteristics and evidence alongside cost	Claims substantiation and local suitability
Recovered / organic nutrients	Connect approved products and potential buyers	Product compliance, consistency, contaminants and handling
Lower-emission products	Provide sourced environmental attributes where documented	Methodology and independently verifiable claims

Demand aggregation

If many farms plan to buy compatible products in the same period, AgriSpot could present suppliers with a clearer pool of demand and reduce repetitive procurement administration. Aggregation only creates savings when supplier competition, delivery costs, volumes, timing and product specifications support them.

Crop / input coordination

The platform could bring together a farmer-supplied yield assumption, executable crop prices, planned fertiliser requirement and available input offers to estimate scenario margins. It should present assumptions and sensitivities, not prescribe agronomic decisions or imply that a forecast is certain.

> **Recommended timing**
> Add fertiliser after the first physical spot market has repeat users. It provides year-round engagement and strengthens supplier relationships without forcing the company to take inventory risk.

06 / MARKET RISK

Build toward risk management, not a speculative exchange

Agricultural derivatives are a longer-term layer. Initially, AgriSpot can connect real physical exposures with existing benchmarks and appropriately authorised providers.

There is already an established UK feed wheat futures benchmark. ICE Futures Europe describes its UK Feed Wheat contract as a physical market reference, with a contract size of 100 tonnes and delivery from registered stores in mainland Great Britain. [4]

Local physical prices can differ from futures benchmarks because of location, grade, delivery timing, storage and local supply-demand conditions. This difference is called the basis. A futures hedge can reduce exposure to a benchmark price move but does not automatically eliminate local basis risk or production risk.

A measured sequence

STAGE	PRODUCT / SERVICE	WHY IT COMES IN THIS ORDER
1. Physical forwards	Standardised commercial contracts for future delivery	Direct extension of physical buyer / seller demand; clear delivery and credit risks still apply.
2. Benchmark information	Relevant futures references, local basis observations and price-risk scenarios	Helps users understand the difference between benchmark and achievable local price.
3. Intermediary connectivity	Access to suitable hedging through authorised brokers / providers	Avoids assuming unnecessary exchange, execution or balance-sheet risk at launch.
4. Advanced contracts	Options, basis products or new contracts only if justified	Requires demonstrated demand, liquidity, robust settlement and regulatory design.

Do not launch a separate futures contract for every crop, grade and region. Too many contracts can fragment liquidity and produce weak prices. Begin with transaction data and established references, then test where existing contracts fail to match users' real exposures.

Regulatory note

Whether an activity is regulated depends on the instrument, system and service actually provided. Operating a multilateral trading facility or an organised trading facility may require specific FCA authorisation, and commodity-derivative venues can have position-management and reporting obligations. Specialist UK counsel should assess the intended model before any financial execution or derivatives facility is launched. [5]

Capital discipline

Keep the start-up focused on software, physical-market data and partner connectivity. Do not make principal commodity positions or speculative trading necessary to the core business model.

07 / FINANCE

Give lenders better transaction evidence

AgriSpot could make eligible agricultural activity easier to assess and administer. The opportunity is to supply trusted data and workflow, not to assume that a recorded trade guarantees credit approval.

Agriculture has a seasonal cash cycle: inputs are purchased before harvest, physical goods may be stored after harvest, and payment may follow delivery and invoice validation. Lenders can face information gaps around inventory, contract fulfilment, counterparty risk and the timing of receipts.

USE CASE	AGRISPOT CONTRIBUTION	LENDER CONTROL STILL REQUIRED
Receivables finance	Executed contract, delivery evidence, invoice status and payment history	Invoice eligibility, assignment, disputes, debtor credit and fraud checks
Inventory finance	Stock records, quality, location and sale commitments, where verified	Ownership / title, collateral rights, warehouse controls, valuation and competing claims
Seasonal working capital	Procurement and sales pipeline, relevant historical trade records	Full credit assessment, production assumptions and borrower liabilities
Buyer procurement finance	Contract and supplier visibility, delivery status and invoice workflow	Buyer credit, supplier performance, concentration and payment terms
Commodity hedging	Physical exposure records and relevant price references	Authorised provider, suitability, margin / collateral and product-specific risk

How the partnership could work

- Customer grants specific permission for relevant data to be shared with a chosen lender or authorised intermediary.

- AgriSpot supplies a structured transaction pack and audit trail; the lender performs its own due diligence and retains the credit decision.

- Financing offers, approval status, drawdown and repayment records are reconciled back to eligible transactions where permissions allow.

Bank demand is a commercial hypothesis to test, not an established market-wide trend. Conduct structured discovery with agricultural lending teams, specialist lenders, commodity finance desks and commercial buyers. Seek one use case with a measurable problem before building a broad "banking marketplace".

First pilot to test

Receivables finance for a subset of verified, undisputed sales to creditworthy buyers. It has a documentary chain that can be tested: contract, delivery, invoice and payment.

08 / BUSINESS MODEL

A diversified revenue model around real trade

Transaction fees can start the model; recurring software and data products may improve revenue resilience and customer retention.

REVENUE LINE	POTENTIAL CHARGE	MATURITY / DEPENDENCY
Physical transaction fees	Fee on qualifying executed notional or fixed per-trade fee	Initial core; depends on liquidity and competitive take rate
Merchant / buyer subscriptions	Workflow, contract management, procurement and reporting subscription	Early recurring revenue; depends on clear time / cost savings
Logistics coordination	Fee for qualified booking or coordination service	After repeat trades; operational service levels matter
Input procurement	Transaction or supplier fees for qualifying purchases	After supply-side adoption; careful conflict / disclosure controls
Market data	Premium histories, regional pricing and benchmarks	Requires sufficient quality, depth and repeat coverage
Finance workflow / referral	Contracted fees for permitted data / workflow / introductions	Requires lender partnerships and regulatory review
Risk-management access	Contracted service fees through an appropriate structure	Later stage; permissions, conduct and venue rules apply

Revenue design principles

- Charge primarily for completed commercial value and demonstrable software utility, not merely for listing a product.

- Avoid incentives that reward low-quality quotes, duplicate listings or trades that are unlikely to complete.

- Disclose any supplier-paid placement or financing-related commercial arrangement. Protect customer-specific transaction confidentiality.

- Prefer partners for lending, custody, regulated execution and payment functions until there is a compelling evidence-based reason to internalise them.

Why the blend matters

Commodity trading is seasonal and fee competition can be intense. Subscriptions and premium data may help smooth revenue, while input procurement creates a second recurring transaction loop. Financial services can be valuable, but should not be counted in an investment case before the business has demonstrated demand and legal pathways.

> **Core economic question**
>
> Can AgriSpot earn more from a retained customer over time than it spends to acquire, onboard, support and serve that customer, while keeping the physical market attractive to both buyer and seller?

09 / ILLUSTRATIVE ECONOMICS

Transaction volume: the arithmetic of scale

Agricultural marketplaces can process substantial notional value while retaining only a small proportion as revenue. This sensitivity makes the required scale visible without presenting a forecast.

Gross transaction revenue at alternative execution volumes and fee yields

ANNUAL EXECUTED NOTIONAL	0.10% FEE YIELD	0.20% FEE YIELD
£100m	£100,000	£200,000
£500m	£500,000	£1,000,000
£1bn	£1,000,000	£2,000,000
£5bn	£5,000,000	£10,000,000

Calculation: eligible executed notional multiplied by an assumed blended transaction fee. This assumes the stated fee yield applies across the entire notional; actual fee-bearing volume, discounts, reversals, payment costs, bad debt and contract types will differ. Figures are gross transaction revenue before operating costs and are not projections.

Example of a possible blended model (not a forecast)

ASSUMPTION	ILLUSTRATIVE INPUT	ANNUAL REVENUE
Executed physical trade value	£500m at a 0.15% blended yield	£750,000
Software subscribers	250 customers at £200 per month	£600,000
Institutional / enterprise contracts	10 contracts at £30,000 annually	£300,000
Illustrative total	Before other lines and before costs	£1,650,000

This example is intended to demonstrate the interaction between marketplace volume and recurring revenue. None of the customer counts, price points, fee rates or revenue outcomes is supported by an established AgriSpot operating history. Validate every input through pilots and customer interviews.

Unit economics to track

- Contribution margin per completed trade, after payment, verification, support and dispute-related costs.
- Customer acquisition cost and payback by farmer, merchant and enterprise buyer segment.
- Annual recurring revenue, churn, expansion and gross margin for software customers.
- Revenue concentration by commodity, customer and region; capital tied up in any service that creates payment timing risk.

10 / GO-TO-MARKET

Win a narrow market, then widen the network

The sequence should be gated by trading quality and unit economics, rather than a launch timetable that assumes adoption will happen automatically.

PHASE	FOCUS	DELIVERABLES	GATE TO ADVANCE
1. Spot market	One or two grains in selected regional lanes	Executable bid / offer, contract templates, counterparties, fulfilment statuses	Repeat trading, meaningful conversion and reliable settlement
2. Operations	Contract-to-delivery workflow	Quality and weight records, delivery coordination, invoice reconciliation	Measured reduction in friction and acceptable fulfilment rate
3. Inputs	Fertiliser and selected inputs	Supplier offers, product data, delivered-cost comparisons	Repeat demand and competitive supplier coverage
4. Finance pilots	One lender / one use case	Permissioned transaction pack, receivables or inventory workflow	Partner commitment and evidence of improved processing
5. Market data & risk	Regional indices and hedging connectivity	Published methodology, basis analytics and suitable providers	Data depth, governance, legal clearance and buyer demand

Initial commodity focus

Start with feed wheat and feed barley, then assess oilseed rape, oats or other grains where buyer concentration, grade definition and delivery conditions support liquid trading. Add fertiliser after the core buyer / seller network is active. Treat potatoes, fresh produce, dairy and livestock as distinct later markets because they require different cold-chain, perishability, traceability or contracting capabilities.

Commercial launch motion

- Recruit anchor buyers first: feed manufacturers, grain merchants, processors and repeat commercial purchasers.

- Recruit supply within those buyers' economically viable catchments to ensure offers can actually be delivered.

- Offer low-friction onboarding and a transparent fee model; provide assisted execution until workflows become routine.

- Use pilot transactions to measure achievable net prices and delivered cost, not just website activity.

A concentrated regional strategy builds density. If early trades are dispersed across the entire UK, transport economics and thin order books may undermine the user experience.

11 / PLATFORM ARCHITECTURE

A trusted data spine from farm gate to finance

AgriSpot needs a dependable record of each commercial lot and each event in its lifecycle. Sophisticated financial products are only as credible as the underlying data.

LAYER	CORE CAPABILITY	DESIGN PRIORITY
Identity & permissions	Business verification, user roles, consent and data-sharing permissions	Least-privilege access, traceable consent and clear customer controls
Commodity & contract model	Standardised units, grades, tolerances, delivery points and contract states	Versioned terms and explicit distinction between firm and indicative prices
Trade execution	Bids, offers, acceptances, audit events and counterparties	Unambiguous record of who agreed what and when
Fulfilment	Weighing, sampling, quality, transport, storage and delivery evidence	Source provenance, exception handling and independent verification
Payments & finance	Invoice matching, payment status and lender data packs	Security, reconciliation, no implied payment guarantee
Market data	Transaction histories, price indices, basis analytics and reporting	Methodology, representativeness, confidentiality and correction policy

Minimum governance for a credible price benchmark

- Publish how eligible transactions are included, weighted, excluded or corrected; distinguish quotes from completed trades.

- Monitor small samples, outliers, duplicate trades, related parties and concentration that could distort a regional price.

- Record commodity grade, delivery and price basis consistently; avoid publishing a single blended price when products are not comparable.

- Apply access controls to customer-specific data and publish only permitted, appropriately aggregated information.

Build-versus-partner

Build the contract model, marketplace workflow, audit trail and data governance as core intellectual property. Partner for logistics capacity, quality testing, payment rails, credit underwriting and regulated financial execution wherever external specialists have a material advantage.

> **Why data quality is strategic**
>
> Reliable trade history can support better procurement, forecasting and eligible finance. Poorly classified or unrepresentative trades can do the opposite and undermine market confidence.

12 / RISK & REGULATION

Risks that should shape the product from day one

A credible investment case makes risks explicit and designs controls into the commercial model rather than treating them as legal footnotes.

RISK	HOW IT CAN HURT	PRACTICAL MITIGATION
Low liquidity	Few competitive offers; customers take trades offline	Concentrate geography and commodity; anchor demand; measure repeat execution
Non-performance	Failed delivery, non-payment or disputes damage trust	Onboarding, credit checks, standard terms, exposure limits and dispute process
Production uncertainty	Forward seller may not deliver expected quantity or grade	Make obligations explicit; use tolerances; support realistic exposure management
Quality / stock data	Wrong grade, duplicate lot or overstated inventory	Evidence provenance, checks, inspections and clear status distinctions
Working capital	Platform funds settlement timing or customer defaults	Avoid principal funding at launch; ring-fence money flows and partner with lenders
Regulatory scope	Financial execution, venue, payments or credit activities require permissions	Early specialist legal review; activity-by-activity permissions map
Data misuse	Loss of trust or confidentiality breach	Consent, least-privilege access, audit logging and incident response
Index manipulation / bias	Thin or unrepresentative trades distort published prices	Transparent methodology, surveillance, sample thresholds and correction rules
Supplier claims	Misleading nutrient, performance or environmental statements	Product documentation and independently supportable claims

Regulatory perimeter

The initial physical marketplace and any later financial layer should be reviewed separately. FCA guidance describes multilateral trading facilities and organised trading facilities as venues that facilitate interaction among multiple third-party buying and selling interests in financial instruments; whether a particular model falls within the perimeter depends on its actual activities and instruments. Commodity-derivative venue rules can also include position management and reporting requirements. [5]

This prospectus is not legal advice. Before live execution, obtain UK advice on contract enforceability, market conduct, data protection, payments, financial promotions, financial instruments, venue permissions and the allocation of settlement risk.

13 / INVESTMENT CASE

The case to fund is a sequence of proof points

The near-term objective is not to build every layer. It is to prove that a trusted physical market can attract repeat trade and create a useful transaction record.

What investors are funding

- Market formation: anchor buyers, suppliers, regional density and repeat transaction flow.
- Execution reliability: contract controls, evidence of delivery, invoice reconciliation and customer support.
- Product infrastructure: commodity data model, marketplace engine, audit trail and partner integrations.
- Commercial validation: measured willingness to pay for transaction execution and workflow software.
- Option value: a credible base for input procurement, market data and permissioned financial partnerships.

Operating dashboard

METRIC	WHAT IT TESTS	WHY IT MATTERS
Executed volume & transactions	Whether participants trade, not just register	Liquidity is the core marketplace product
Repeat trade rate	Recurring user value	Retention and network credibility
Bid-to-trade conversion	Quality of matching and price attractiveness	Weak conversion points to poor market design
Fulfilment / settlement rate	Reliability after contract execution	Lenders and buyers need dependable records
Net realised seller price / buyer cost	Customer outcome after applicable costs	Tests whether the platform creates economic value
Contribution per trade	Economics after variable costs	Shows whether growth can translate to margin
ARR / churn / payback	Recurring software economics	Tests revenue resilience and sales efficiency
Financing facilitated	Demand for financial connections	Count only completed, eligible financing - not referrals alone

Key diligence questions for investors

- Which two commodity-region lanes have named anchor buyers ready to transact?
- What does each party currently spend in time, cost and margin to execute a similar trade?
- What percentage of listed availability is genuinely firm, deliverable and not already committed?
- What credit, fulfilment and disputes processes will be required before enterprise buyers participate?
- What is the regulatory boundary of the intended physical marketplace, and which functions will be performed by partners?

> **Investment conclusion**
>
> The strongest version of British AgriSpot is a capital-disciplined market-infrastructure company. It starts by making physical trade work better, then compounds the resulting transaction data into procurement, software and finance-related services.

14 / SOURCES & DEFINITIONS

Evidence base and important qualifications

Official statistics and market-rule sources inform the background claims. All business design, adoption assumptions and financial scenarios are proposed hypotheses unless explicitly stated otherwise.

[1] Department for Environment, Food & Rural Affairs (Defra). Agriculture in the United Kingdom 2025 - Summary. Updated 3 September 2026. Includes agricultural area, accounts and output summaries. gov.uk/guidance and statistics page.

[2] Defra. Agriculture in the United Kingdom 2025 - Chapter 4: Accounts. Updated 3 September 2026. Source for total income from farming, crop and livestock output, intermediate consumption and fertiliser expenditure. Official chapter.

[3] Defra. Government acts to strengthen fairness and transparency in combinable crops contracts. 10 December 2025. Describes review themes including clear prices, standards, sampling, testing, supply volumes, data sharing and dispute resolution. Official announcement.

[4] ICE Futures Europe. UK Feed Wheat Futures. Current product information. Describes the contract as a reference for physical feed wheat pricing, with 100-tonne contract size and physical delivery from registered stores in mainland Great Britain. Product specifications.

Definitions and reading guide

- TIFF: Total Income from Farming, an aggregate measure of income to owners of farming businesses; it is not a measure of AgriSpot market size.

- GVA: Gross Value Added; an economic contribution measure, not company revenue or gross merchandise value.

- Executed notional: stated value of contracts actually executed through the platform, before any adjustments used in the fee calculation.

- Basis: difference between a local physical commodity price and its relevant futures benchmark, which may change over time.

- Illustrative: a scenario to explain arithmetic or a potential workflow, not a forecast or commitment.

Important notice. This document is a strategic discussion paper prepared for prospective investors, economists and commercial partners. It is not an offer to sell securities, a solicitation, investment advice, legal advice, a credit offer or a forecast of future performance. Market statistics reflect the cited sources and publication dates; they may be revised. Market sizes, fees, customer numbers, revenues and operational benefits attributed to AgriSpot are hypotheses for validation. Regulatory obligations depend on the final operating model and should be assessed by qualified advisers before launch.
