BRITISH GOODS. FINANCED FOR GLOBAL TRADE.

Premium British production. A lower-friction supply chain. Finance designed around the movement of goods.

THE MARGINAL COST REVOLUTION

Not a race to the bottom. A better way to buy premium goods: reliable specifications, repeatable orders, managed price exposure and appropriately structured working capital.

QUALITY	CERTAINTY	LIQUIDITY
Specified and evidenced	Contracted, not assumed	Financing matched to trade

A concept prospectus for international importers, distributors and procurement teams.

Pay for performance - not friction.

For buyers who demand the highest standard, British-made goods can be positioned as a premium choice on precision, provenance, service support and lifetime value. The proposition is not that every British product is automatically superior; it is that quality can be specified, tested and financed as part of one commercial offer.

£392.2bn

UK goods exports in the 12 months to July 2026

£204.5bn

goods exports to non-EU markets over the same period

47.9%

of UK goods exports went to EU markets in that period

Source: UK Department for Business and Trade, drawing on ONS UK trade: July 2026.

A practical advantage for importers

01

Premium value

Lead with performance, not the lowest first quote. Compare useful life, downtime, repairability, warranty, certification and technical support.

02

Evidence-led quality

Make inspection plans, product specifications, test results, batch traceability and acceptance standards part of the order.

03

Global commercial reach

Structure transactions for the buyer's market: agreed delivery terms, export documentation, currency planning and a realistic cash-conversion cycle.

What makes a premium offer credible?

- **Specification**
  Material, tolerances, grade, origin and approved substitution rules.
- **Verification**
  Independent testing, inspection rights and clear rejection / remedy procedures.
- **Service**
  Spare parts, maintenance, training and response-time commitments.
- **Economics**
  Total landed cost and lifetime cost, not just the ex-works unit price.

THE COMMERCIAL POINT

Premium pricing only works when buyers can see what the premium buys. The procurement file should make quality measurable and put the associated costs - freight, insurance, financing, customs and after-sales support - into one comparable landed-cost view.

Premium quality. Lower friction per order.

The economic opportunity is to reduce the avoidable cost wrapped around a premium product - duplicated sourcing work, errors, idle stock, payment friction and unpriced uncertainty - without pretending that materials, skilled labour or quality assurance are free.

TOTAL LANDED COST

Product + fulfilment + finance + risk + compliance + after-sales

Where the revolution comes from

1 **FIXED COSTS**

Design, tooling, automation, software, testing and certification are often investments made before each additional unit is produced.

2 **LOWER FRICTION**

When order data, documents and checks can be reused, each repeat transaction can need less manual handling and fewer corrections.

3 **PREMIUM PRESERVED**

Better process control can support repeatable quality, while working-capital finance helps suppliers deliver without forcing buyers into unnecessary early cash outflow.

WHERE VALUE CAN ACCRUE

Reuse specifications. Reduce repeated qualification work.

Consolidate demand. Pool planned orders and shipments where service levels permit.

Digitise documents. Reduce avoidable discrepancies and processing delays.

WHAT IT DOES NOT MEAN

Marginal cost is not always falling. Small batches, low factory utilisation, scarce inputs, energy prices, exchange rates, tariffs and quality failures can move costs in the opposite direction. Benefits must be measured supplier by supplier.

Buyer test: compare the full landed cost per conforming unit, and the cost of ownership over the expected life of the product. A lower invoice price may not be the better economic purchase.

Price stability is built into the contract.

Markets move. A robust buying programme does not claim to abolish volatility; it defines which risks are held by the buyer, held by the supplier, passed through under agreed rules or hedged through a suitable financial provider.

A price-certainty toolkit

01 Quote validity & reset dates

Agree a fixed-price window, expiry date, review dates and what happens if a quote is not accepted in time.

02 Currency alignment

Price in GBP or the buyer's operating currency where commercially possible. Use bank or regulated-provider FX forwards only after confirming exposure and suitability.

03 Volume bands & call-offs

Set price tiers, minimum order quantities, rolling forecasts and delivery call-offs. Avoid a volume promise that exceeds real demand.

04 Input-cost formula

If key inputs are volatile, agree the index, base date, adjustment frequency, cap / floor and evidence required before signing.

05 Delivery risk allocation

Define Incoterms, insurance, freight, customs responsibility, inspection points and when title / risk transfers.

06 Quality & remedy rules

Set sample approval, permitted tolerances, testing, claims windows, repair / replacement terms and responsibility for non-conforming goods.

STABILITY IS A DESIGN CHOICE

Use a defined contract price, transparent adjustment rules and appropriate hedging to make costs more predictable. Hedging can reduce a specified exposure; it does not remove every risk and can introduce its own cost, basis risk, liquidity requirements or collateral obligations.

Before the purchase order is released

Confirm: product specification / origin evidence / delivery basis / tax and customs treatment / currency and payment date / finance cost / inspection and claims process / any sanctions, licensing or product-compliance requirements.

One import order. A coordinated finance stack.

In this prospectus, "synthetic financing" means a proposed way to assemble suitable financial instruments around one verified import-export transaction. It is not a claim that a standardised, universally available product exists under that name.

THE PRINCIPLE

Coordinate the buyer's payment terms with the supplier's need for cash, using the order, documents, receivables, inventory, guarantees and currency exposure as inputs to underwriting - rather than treating every part as a separate problem.

How a transaction can be assembled

1. **ORDER** — Agreed goods, specification, supplier and price.
2. **VERIFY** — KYC, origin, documents, delivery terms and credit.
3. **STRUCTURE** — Select the eligible finance and risk tools.
4. **SETTLE** — Supplier paid at agreed milestone; goods move.
5. **REPAY** — Importer pays lender on agreed dates.

Potential building blocks - selected for the transaction

Buyer credit / import loan	Finance the buyer's payment obligation over an agreed tenor.
Receivables purchase / payables finance	Give the supplier earlier cash against an approved invoice or receivable.
Inventory or pre-shipment finance	Fund approved goods or production when the security, warehouse controls and lender appetite support it.
Letters of credit / guarantees / insurance	Allocate non-payment and performance risks through agreed bank or insurance instruments.
FX management	Match purchase-currency exposure to the buyer's cash flows; hedge only the exposure and tenor that are understood.

WHAT EXISTS TODAY

UK Export Finance already has several export-support products, including a Buyer Credit Facility and working-capital support for eligible UK exporters and supply chains. These are application-based, eligibility-bound schemes, not automatic credit for every overseas importer. A proposed synthetic structure would have to be matched to an actual lender, product and transaction.

A clearer route from quote to delivery.

The process should make the commercial terms and the financing decision legible to both sides. The example below is illustrative only; it is not a financing offer, approval, quote or prediction of available terms.

ILLUSTRATIVE CASE

£1,000,000

A premium industrial-equipment order supplied from Britain to an overseas distributor.

THE BUYER NEEDS

Cash to support inventory, enough time to sell through, and a manageable currency exposure.

Possible sequence, subject to approval

01 **Agree the deal**

Buyer and supplier confirm the bill of materials, quality evidence, delivery basis, price validity and acceptance milestones.

02 **Underwrite the flow**

A lender reviews buyer credit, supplier, destination, documents, repayment source, currency, security and any required guarantees or insurance.

03 **Pay the supplier**

If approved, funding is released at the agreed trigger - for example a documented shipment or approved invoice - under facility terms.

04 **Import and sell**

Goods clear customs and enter the buyer's stock or project. Inspection, claims and documentation work exactly as the contract states.

05 **Repay on schedule**

The buyer repays on the agreed dates. FX hedging may be arranged separately if appropriate and available.

WHERE THE MODEL MAY FIT

Industrial and energy equipment / Scientific instruments / Automotive and transport components
Life-science and healthcare products / Materials and specialist chemicals
Premium food, drink, textiles and consumer goods

Each sector has its own rules on product conformity, licensing, labelling, export controls, sanitary or phytosanitary measures, customs and sanctions. Those checks precede any credit decision.

Build the trade file. Then structure the finance.

A strong importer application starts with a real transaction, not a generic promise of cheap credit. The more complete the evidence, the easier it is for a supplier and finance provider to assess the proposition.

THE IMPORTER CHECKLIST

- **Goods**
  Product, HS code if known, specification, quantity, value and UK origin evidence.
- **Supplier**
  Legal identity, manufacturing role, capacity, inspection history and references.
- **Delivery**
  Destination country, Incoterm, shipment schedule, insurance and customs route.
- **Payment**
  Deposit or milestone terms, desired repayment dates, buyer currency and source of repayment.
- **Credit**
  Recent financials, ownership / KYC, banking information and existing borrowing.
- **Risk**
  Quality remedies, returns, insurance, permits, sanctions checks and dispute jurisdiction.

A PRACTICAL ROUTE

01 Buyer defines the purchase

02 UK supplier confirms capability and terms

03 Finance provider assesses buyer, goods and country risk

04 Parties agree price, payment triggers and documents

05 Lender issues final terms and documentation

06 Shipment, verification and scheduled repayment

IMPORTANT INFORMATION

Status. This document is a concept prospectus for commercial discussion. It does not identify an operating marketplace, promise that finance is currently committed, or constitute an offer, arrangement, invitation or recommendation to lend, borrow, hedge, insure or invest.

Synthetic financing. The phrase is used here as a descriptive label for a proposed transaction-by-transaction architecture that combines existing instrument types where appropriate. Actual availability depends on independent lenders, insurers, eligibility, credit approval, collateral, legal documentation and local regulation.

No guarantee. All finance charges, guarantee fees, insurance premiums, FX costs, taxes, duties, freight, product standards and delivery obligations must be confirmed for each transaction. Export-credit support is subject to scheme rules; this prospectus is not issued by or endorsed by UK Export Finance, the UK Government or the ICC.
